

File 1) surf_z0028.dat:

The surface abundance data table from Karakas et al. (2018) for stellar models calculated with an initial $Z = 0.0028$. The file comprises 35 models with permutations of each initial mass, M_{mix} and mass-loss. Each model includes 1) initial abundances used in the post-processing calculations; 2) abundances calculated at M (16-81) thermal pulses; 3) final elemental abundances, calculated at the last time-step, which may fall on a thermal pulse or during the interpulse period. Each thermal pulse entry includes the following stellar parameters: stellar mass (Mass), core mass (M_{core}), envelope mass (M_{env}), and surface luminosity ($\log L$) expressed in solar units. At each thermal pulse abundances are provided for 81 elements along with the surface elemental ratios of He/H, C/O and N/O.

File 2) isotope_z0028.dat

The isotopic surface abundance data table from Karakas et al. (2018) for stellar models calculated with an initial $Z = 0.0028$. The file comprises 35 models with permutations of each initial mass, M_{mix} and mass-loss. Each model provides information on 36 isotopic ratio pairs, where each model includes 1) the initial ratios used in the post-processing calculations; 2) the ratios calculated at M (16-81) thermal pulses; 3) the final isotopic ratios, calculated at the last time-step, which may fall on a thermal pulse or during the interpulse period.

File 3) yields_z0028.dat

The yield data table from Karakas et al. (2018) for stellar models calculated with an initial $Z = 0.0028$. The file comprises 35 models with permutations of each initial mass, M_{mix} and mass-loss. For each model, final and expelled masses are given (in solar units) and yield abundances tabulated for each of 81 elements along with s-process indicators [Rb/Zr], [ls/Fe], [hs/Fe], [hs/ls], [Pb/hs].
